---	--

The Community PRO Series are wall mounted systems that can take existing water and produce up to 15 GPM of disinfected, potable water. The pre-wired assemblies make these systems turn-key packages that only require an existing source of water and electricity. These systems require a minimum of 20 psi to push through the filters. The Ultraviolet Light has the ability to kill bacteria and viruses such as *E-coli*, *coliform bacteria*, *cholera*, *influenza virus*, and more.

The Ultraviolet Light life expectancy (under normal usage) is 9000 hours.

The Reusable Pleated Filter (on Community PRO UV-4 systems) has a life expectancy that can last up to 4-6 months, but depends on the cleanliness of incoming water.

The Carbon Block Filter (Community PRO UV-3 & UV-4 systems) has a life expectancy of 100,000 gallons.

The Sediment Filter (on Community PRO UV-2, UV-3, & UV-4 systems) has a life expectancy of that can last up to 4-6 months, but depends on the cleanliness of incoming water.
